

Make your first connection.

Start with a reproducible local API example: recipes, inventory, original discoveries and a completed investigation.

Read what the server offers

Fetch recipe and graph catalogs. Use server-issued actions and content hashes instead of inventing transitions.

Handle state deliberately

The example uses idempotency keys, expected revisions and current sharing permissions. Two fixture accounts contribute separate origins.

Run a real local flow

The supplied script starts real repository handlers against an in-memory database, asserts results and closes. No production credentials required.

Coordination Phases 00–01 are default-off API pilots. The quickstart enables them only in its local process. It is not a hosted onboarding endpoint.
